A FIELD GUIDE · EDITION ONE

Keynot *for* Zombies

Slide decks so simple, even a reanimated corpse with half a brain can make one. No apps. No crashes. Just slides.

PRESS → TO BEGIN

THE CONDITION

Your brain is... *not what it used to be.*

You need slides by morning. You cannot remember which app does what. Every click makes it worse.

SYMPTOMS YOU MAY RECOGNIZE

01 **PowerPoint asks twelve questions before you can type.** Then it crashes.

02 **Keynote only opens on one computer.** Guess which one isn't yours.

03 **Google Slides looks like Google Slides.** You wanted it to look good.

04 **You just want to present something.** Today. In a browser. That's all.

THE CURE · THREE EASY STEPS

You talk. Claude types. A *deck* appears.

01 Say what you want

"Make me a deck about X for audience Y." One sentence is enough. Keynot will ask follow-ups if it needs them.

02 Claude writes the HTML

A single self-contained file. Brand colors, fonts, layouts, reveals — all baked in. No build step, no dependencies, no install.

03 Open it in a browser

Arrow keys to navigate. F for fullscreen. Swipe on mobile. That's the whole thing. Present from any machine that has a browser.

INCLUDED IN EVERY DECK

One file.
Everything inside.

Self-contained HTML

Fonts via CDN, images as base64. Email it, AirDrop it, stick it on a thumb drive.

Fullscreen with one key

Press F. No “Presenter Mode” wizard. No second monitor setup ritual.

Animated reveals

Staggered fade-ups per slide, built in. No PowerPoint transition menu required.

Keyboard & swipe nav

Arrow keys, spacebar, touch swipes. Dots show progress. Nav auto-hides.

Brand-matched design

Hand it a style guide and it reads the colors, fonts, layout language.

Iterable by chat

“Slide 3: swap the headline.” Done. No hunting through a sidebar of 40 objects.

Now go eat some *slides.*

Open Claude Code. Type "make me a deck about..." Watch the skill wake up. The rest is autopilot.
